

## Page 131 Brian Powell

Obtaining the last item of a list, say 'eighties' using the length of the list:

`eighties[len(eighties) - 1]` # As the index starts with 0, the length of the list will always be greater than the last index

### Conventional Way:

`length = len(eighties)`

`last = eighties[length - 1]`

`print(last)`

### Using Negative Indices:

`last = eighties[-1]`

`print(last)`
