```
print ('The glass is', glass)
```

Brain Power: Page 201

Outputs are:
   Drinking (empty) glass
   The glass is full
Real test output:
   Drinking full glass
   The glass is full

# I didn't expect the first output. Also, thought
   param = 'empty' statement should come before
   msg = 'Drinking ' + param + ' glass ' statement.
   Then the output would be the same as I expected
   Although, Drinking an empty glass wouldn't make sense.
